ADVANCE PREVIEW / PUBLICATION FORTHCOMING

Audio, Print, or Both?

A practical decision toolkit for adults
supporting young readers
By X | ContentX

Explore the complete first chapter, two explanatory diagrams, Source Notes, Scope Limitations, and a separate printable Caregiver Decision Card. Cover, frontmatter and the AI-production disclosure are included.

This is a 19-page advance sample of an 82-page draft, not the complete ebook or audiobook. Original draft labels and page numbers are retained. Publication is forthcoming; this preview does not establish marketplace availability.

The planning tools are original and unvalidated. Fictional examples are illustrations, not testimonials or measured learning outcomes. The research does not establish demand, sales or guaranteed benefits.

Editorial, accessibility, audiobook quality, full listening and release checks remain separate. No human expert endorsement, publication approval or sales result is claimed.

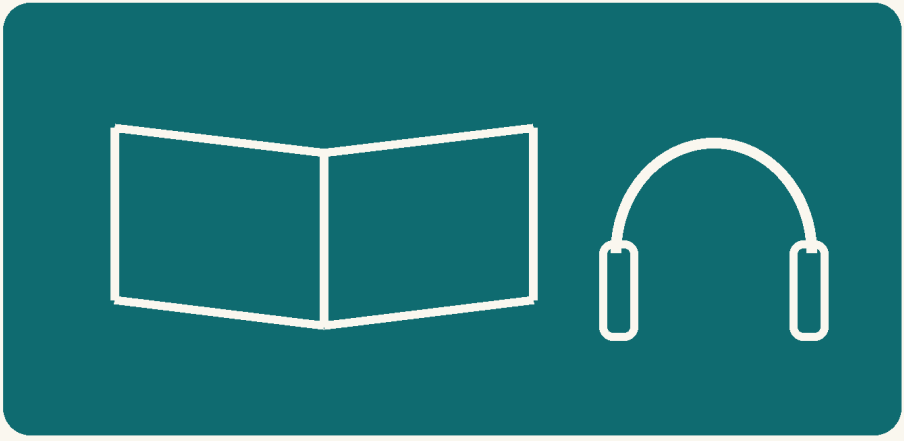
Audio, Print, or Both?

A practical decision toolkit for adults supporting young readers



X

Private review draft. Published by ContentX. Author name: X.

About this edition

X is the author name used for this book. Published by ContentX. The book offers original, unvalidated planning tools for parents, caregivers, tutors and educators. Sources, population limits and the distinction between observation and causal evidence are explained in the Source Notes and Scope Limitations.

Production note: This book was developed with AI-assisted drafting and editorial revision. Its source notes describe the limited research actually reviewed. The families, dialogue and completed tools are fictional illustrations. AI agent reviews are not endorsements by human educators, clinicians or researchers. The cover and diagrams are original locally authored designs; the ContentX logo is the publisher's supplied brand asset.

Acknowledgments

This book draws on the research synthesis and official guidance identified in its Source Notes. The practical templates are original proposals and should not be mistaken for validated interventions or for a recommendation endorsed by the cited organizations. Thank you to readers who approach format choices with care for each child’s dignity and access.

Chapter 1

What Format, for What Goal?

It is 7:40 on a Tuesday night. The dishes are still in the sink. Your seven-year-old has a book open on the couch, and you are holding a tablet with an audiobook queued up. You have about fifteen minutes before bedtime. Do you hand over the tablet, sit down with the print book, or do both at once, audio playing while small eyes track the words? You are not looking for a philosophy of reading. You want a decision you can make tonight, with this child, for this book. And you want to make it well.

This book helps you make that audio, print or simultaneous text-with-audio decision on purpose: name the goal, choose an accessible arrangement for a practical reason, and notice what happens without turning a good night into proof.

One invented decision, filled in

This family is fictional; the entry illustrates a choice, not a measured result.

1. Clarify the goal. Enjoy one chapter together tonight.
2. Check the evidence condition. Research does not establish the best arrangement for this child or validate this card. This is an enjoyment and access decision.
3. Match format to task. Offer the accessible print book with its recording because the child asks to

follow the words while listening. Keep their usual supports in place.
4. Try briefly and observe. Let the child pause. Record one comment or other communication and what happened.
5. Document and review. “Asked to pause at the dragon scene; wanted to continue. Offer a choice again next time and review the notes on Sunday.” That note does not show that audio caused better reading.

On another invented evening, a child finds that narrator uncomfortable and prefers their accessible print book with adult support. The adult changes that optional arrangement, rather than treating print as superior or removing needed audio access. Chapter 8 explains how to check the setup before changing a format.

Make it your own

Write the same five labels on a scrap of paper, or use the copyable card in Appendix A. “Evidence condition” simply asks who the research studied, what it compared and what remains unknown for your choice. It is fine to write “not established for this choice.”

Keep the evidence in view

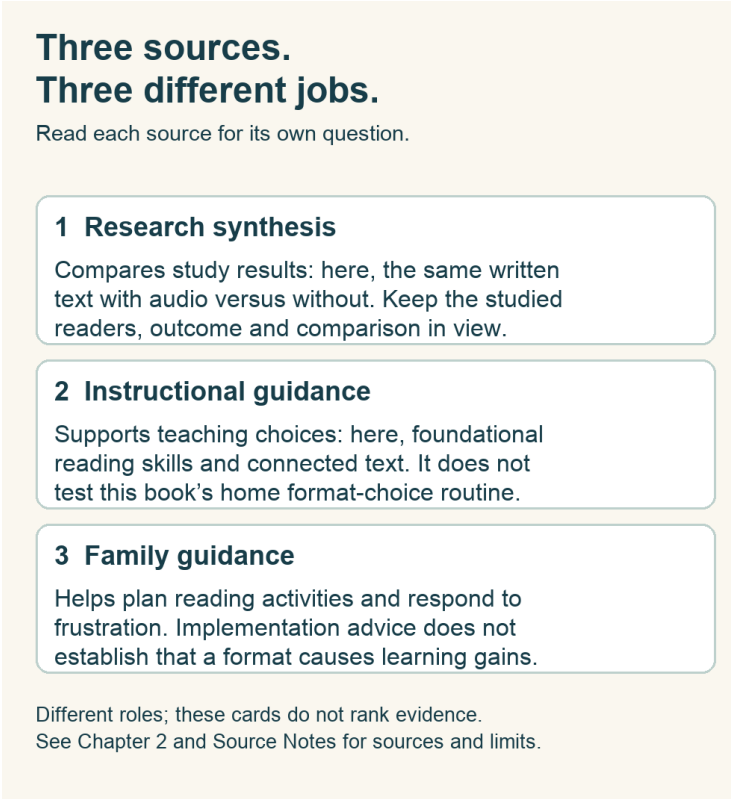
The research synthesis—a study that brings results from multiple studies together—compared the same written text read while listening with that text read without audio. Participants of different ages could already read independently; people still learning to read words and people with relevant learning, hearing and vision

disabilities were excluded. It measured understanding of the particular texts studied, not long-term reading development. Its average result cannot select a home routine or settle an access need. Audio-only, listening before reading and taking turns with a caregiver are different arrangements.

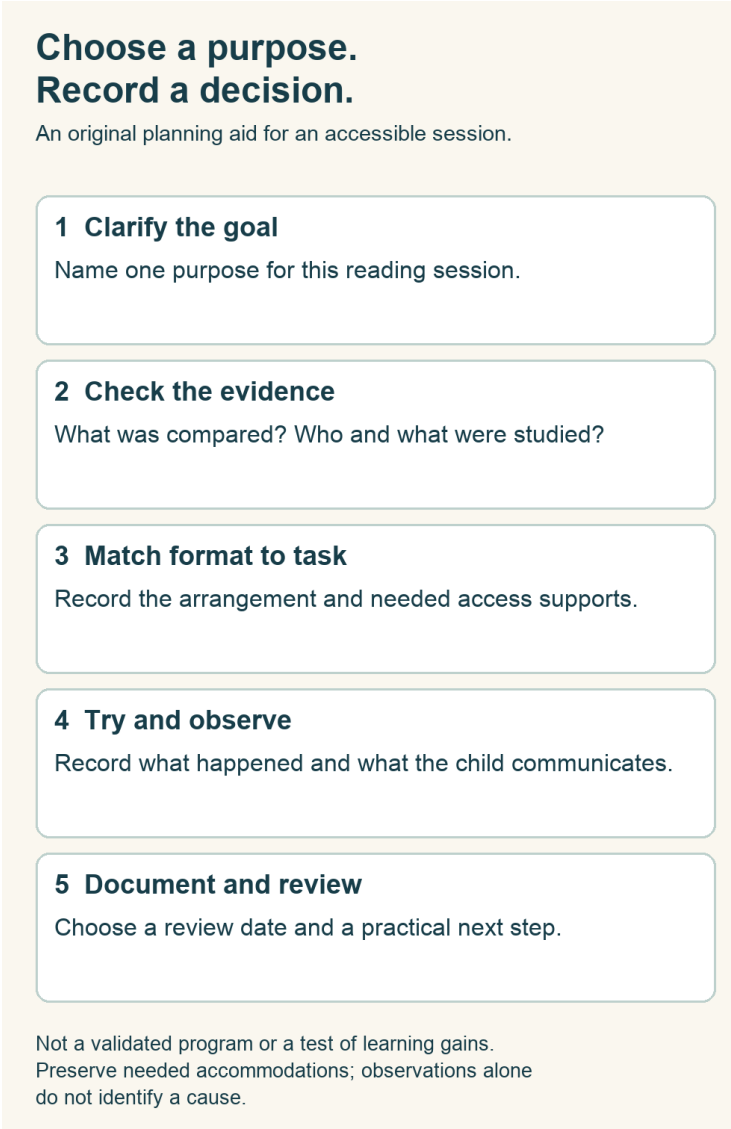
The five-step tool is an original, unvalidated planning proposal. It does not diagnose a difficulty or demonstrate a learning gain. Choose a manageable observation period; there is no tested time requirement. Source Notes preserves the numerical results and source details; Scope Limitations sets out what was not reviewed.

Find the next tool

For a quick home decision, go to Chapter 5, The Caregiver Decision Card. For a teaching session, go to Chapter 6, The Session-Planning Worksheet. Chapter 2 shows how to sort a research claim; Chapter 3 explains the pacing trap; Chapter 4 walks through each step. Chapter 8 covers access and when an optional audio setup is not the right tool. Appendices A–C contain blank tools. Include the child's preferences and communication, keep needed accommodations in place, and involve their relevant team when needed.



Original authored explanatory diagram: three source roles, not a ranking. See Chapter 2 and Source Notes for the source limits.



Original authored planning diagram; not a validated intervention or a test of learning gains. Keep needed accommodations; observations alone do not establish cause.

Source Notes

Scope in brief

The Clinton-Lisell synthesis compared the same written text read with audio against that text read without audio, for comprehension of the studied texts. Its mixed-age participants could already read independently; decoding beginners and people with relevant learning, hearing and vision disabilities were excluded. It cannot select a home routine, establish long-term reading development or settle an individual access need. A nonsignificant comparison does not establish equivalence.

The WWC resource gives teacher-led foundational-instruction recommendations; REL Southeast offers positive-activity guidance. Neither validates a format choice or this book's original tools. Cards, logs, timings and review windows are unvalidated planning proposals. Fictional entries are illustrations, not observations or testimonials. A home record cannot establish cause or diagnose a difficulty. Keep needed accommodations and involve the child and relevant team.

The detailed numerical results, exact source roles and source URLs follow; Scope Limitations records what was not reviewed.

Sources and the claims they support

1. Clinton-Lisell, Virginia. (2023). Does reading while listening to text improve comprehension compared to

reading only? A systematic review and meta-analysis. Educational Research: Theory and Practice, 34(3), 133–155. https://files.eric.ed.go
v/fulltext/EJ1403866.pdf

This systematic review/meta-analysis supplies the book's direct reading-with-audio versus reading-without-audio comparison. It includes 30 studies, 1,945 participants and 62 effect sizes. The overall result was g = .18, SE = .07, 95% CI [.04, .32], p = .01: statistically significant but described by the author as trivial. Reported heterogeneity was I^2 = 99.80. These standardized effects are not percentages or expected score gains.

The subgroup estimate when the reading-only comparator was experimenter-paced was g = .41, SE = .12, 95% CI [.13, .70], p = .01. For a self-paced reading-only comparator it was g = .06, SE = .06, 95% CI [−.07, .19], p = .34. This moderator concerns the reading-only comparator, not a prescription for caregiver or audio pacing. Reading-while-listening pacing was not a significant moderator; its Table 2 coefficient was .09, SE .17, t .49, 14 degrees of freedom, p .63, 95% CI [−.29, .46]. These are synthesis results, not causal tests of a home routine. The Table 2 language-status moderator (L1 versus L2) was not statistically significant: coefficient .28, SE .23, t 1.23, 7.28 degrees of freedom, p .26, 95% CI [−.26, .83]. This does not establish equal effects across language groups.

Method and Table 1 establish the independent-reading requirement, exclusion of decoding beginners and learning/relevant vision or hearing disabilities, and

mixed-age samples. The Discussion and Limitations restrict conclusions about long-term reading development. The paper discusses possible struggling-reader comprehension and second-language incidental-vocabulary benefits but says too few studies support generalization. The underlying primary studies were not independently reviewed for this book.

2. What Works Clearinghouse, Institute of Education Sciences. (2016; revised December 2019). Foundational Skills to Support Reading for Understanding in Kindergarten Through 3rd Grade. Practice-guide landing page. https://ies.ed.gov/ncee/wwc/PracticeGuide/21

The reviewed page describes four K–3 instructional recommendations with implementation steps, common obstacles and evidence ratings. It is educator-focused; its audience metadata also includes parent/family. Its recommendation labels are: academic language and vocabulary, Minimal; speech sounds and letter links, Strong; decoding/word parts/writing and recognizing words, Strong; daily student connected-text reading for accuracy, fluency and comprehension, Moderate. These labels rate support for the recommendations, not comparative effect magnitudes, home formats or this toolkit. Two recommendations share Strong. The full linked guide and underlying studies were not independently reviewed here.

3. REL Southeast, Institute of Education Sciences. (January 2020). Supporting Your Child's Reading at Home. https://ies.ed.gov/use-work/resource-library/res

ource/other-resource/supporting-your-childs-reading-home

This family implementation resource provides activities and videos for foundational reading practice. It advises selecting appropriate activities, setting difficult ones aside and aiming for a positive environment rather than frustration. Applying that advice to a pause/check/change routine in this book is the author's unvalidated adaptation. It is not a validated threshold or evidence that this toolkit causes gains. Linked PDFs and videos were not independently reviewed. Free access does not by itself establish permission to reproduce every linked item.

Secondary citation within the reviewed synthesis

Clinton-Lisell's introduction cites Wood, S. G., Moxley, J. H., Tighe, E. L., and Wagner, R. K. (2018), Does use of text-to-speech and related read-aloud tools improve reading comprehension for students with reading disabilities? A meta-analysis, Journal of Learning Disabilities, 51(1), 73–84. https://doi.org/10.1177/0022219416688170

That reference is reported here as a citation within the reviewed Clinton-Lisell paper. It was not independently reviewed and is not added as separately verified efficacy evidence. Its presence is one reason not to confuse the 2023 synthesis's exclusions with absence of all disability-accommodation research.

Consulted guidance, not used for a retained factual claim

Massachusetts Department of Elementary and Secondary Education. (Updated August 18, 2022). Foundational Skills Instruction for All. https://www.doe.mass.edu/massliteracy/literacy-block/foundational-skills/for-all.html

This is educator guidance, not an independently verified primary trial. The book does not derive home format prescriptions from it.

Scope Limitations

Read these limits alongside the practical tools

The book offers proposed ways to plan and record a reading session. The decision cycle, card, worksheet, log, suggested durations and review intervals are original and unvalidated. They do not diagnose, identify a proven best format, establish reading gains or replace necessary accommodations and professional input.

The direct format-comparison source is one meta-analysis, not a collection of primary trials independently checked for this book. It required participants already able to read independently and not learning to decode. It excluded learning disabilities and physical disabilities affecting vision or hearing. Samples included children, adolescents and adults; they were not a K–3 beginning-reader sample.

It compared the same written text read with audio against read without audio. Audio-only listening, hearing a passage before reading, caregiver turn-taking and joint oral reading are different arrangements. Similarity of language such as “paired reading” does not make them the tested comparison.

Its outcomes concern comprehension of the studied texts, including limited second-language incidental-vocabulary findings. That is different from motivation, fluency growth or reading development across new texts over months or years. Some measures were delayed; “studied-text comprehension” does not

mean all outcomes were measured immediately. The author says conclusions about long-term reading-while-listening interventions to build fluency and comprehension cannot be made.

A trivial but statistically significant pooled effect, with very high heterogeneity, is not a uniform or individualized benefit. Nonsignificant estimates are not proof of no benefit or equivalence. Pacing of the reading-only comparator was the relevant moderator; the result does not justify making a caregiver or recording set the child's pace. Synthesis moderator associations do not establish that changing pacing causes a gain.

The WWC page supplies foundational-instruction guidance and evidence labels. It does not validate the book's home format rules or tools. Daily opportunities for student connected-text reading in foundational instruction do not mean every separate enjoyment or access session must include print reading. REL supplies family implementation guidance, not validation of the book's efficacy.

A log can record a child's accessible experience, preferences and observable responses. Exclusion from a synthesis does not make such observations useless. The log cannot show why a difference occurred, establish learning gains, diagnose a disability or settle needed accommodations. Text, prior exposure, adult attention, time and other conditions may differ. Difficulty retelling does not demonstrate avoidance or justify withdrawing needed access support. Involve the child and relevant educators or access professionals as appropriate.

All named families, tutor emails, sample conversations and completed logs used as worked examples are fictional illustrations, not observed testimonials or trial results. Research statistics are sourced findings; proposed planning numbers are adjustable author choices.

Review coverage is narrow: the actual meta-analysis text and government resource pages were reviewed. Linked primary studies, the WWC full guide and linked family PDFs/videos were not independently reviewed. This is not a comprehensive review of all reading research, products or accommodations. No claim about market demand or product superiority follows from these sources.

The Caregiver Decision Card

This is an original, unvalidated planning aid, not a diagnostic test, treatment or proof of learning gains. Keep needed accommodations in place. Include the child's preferences and communication; involve relevant educators or access professionals when needed. Timing and review intervals are adjustable choices. See the book's Source Notes and Scope Limitations.

Child/initials (optional): _____ Date: _____

Text/task: _____ Available time/materials: _____

Preferences, accessible materials and communication: _____

1. Clarify the goal.

Tonight's purpose: _____

2. Check the evidence condition.

What applies, and what remains unknown: _____

It is fine to write "not established for this choice."

3. Match format to task.

Arrangement: print / simultaneous text + audio / audio-only / supported reading / other

Practical reason and support/setup: _____

4. Try briefly and observe.

One thing to notice, including the child's communication: _____

What happened (without a causal explanation): _____

5. Document and review.

Continue / change / stop this optional arrangement: _____

Practical reason: _____ Review date: _____

Question for the child or relevant team: _____

"Evidence condition" means who was studied, what was compared and what remains unknown. The reviewed synthesis compared simultaneous written text with audio against the same text without audio in already independent readers; it excluded decoding beginners and relevant disabilities. It does not validate these tools or decide access needs.
